

New User Communities

Michael Grønager, PhD

*GN3 Innovation Workshop
Copenhagen, October 11th 2011*

NDGF

- Considerations from NDGF 2006-2011
- NDGF @ NORDUnet A/S
 - Operating the Nordic CERN Tier-1
 - Supporting the Nordic CERN Tier-2s
 - And New User Communities
- A common infrastructure for e-Science ?

■ eScience for Nordic Virtual Research Communities

- Nordic WLCG Tier-1
- BioGrid community grid
- CO₂ sequestration community grid
- Computational Chemistry grid
- Material Sciences

- Achievements
 - Make it easy for the user to get on the grid
 - Hiding the grid in an application server
 - Grid support for code compilation
- Some success – a lot of huge runs in 2008
 - Mainly access to compute power
 - Hardly any need to share data
 - Was grid really the right way ?

- Achievements:
 - Dynamic databases
 - Auto updating of these
 - Out of the box MPI enabled bio applications
 - BLAST, HMMER, "R", etc...

- In active use today
 - However, massive use is lagging
 - Integrated into the storage system
 - Not coupled with European efforts
 - Community not fully consolidated?

- Achievements:
 - Auto install based on code snapshots
 - Development based on the CO2-seq. Project
 - Further improvements for "MPI on Grid"

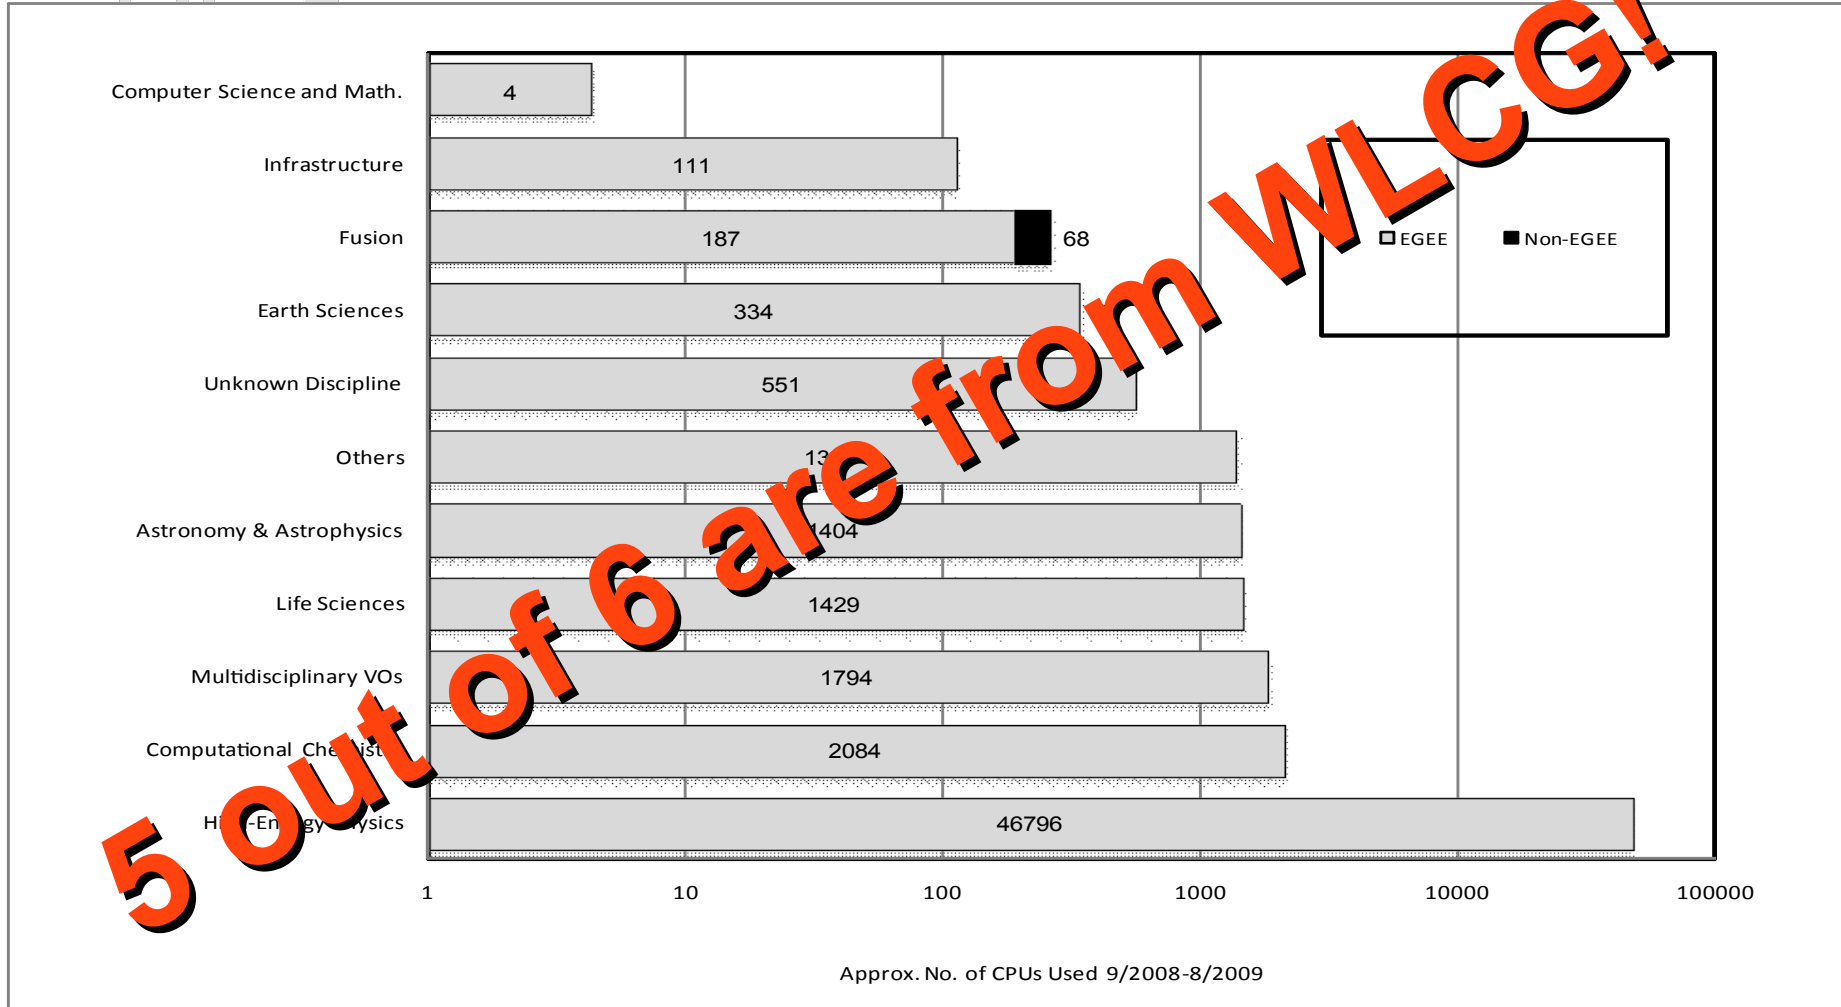

- Hardly in use today
 - No need to share data
 - Is grid right way here ?

- The WLCG community is still, by far, the biggest user of the Nordic distributed infrastructure for Computing and Data
- Why?
 - Grid is for sharing of data !
 - Sharing of Data requires a consolidated community and a good understanding of the data *food-chain*.
 - Other communities have their own tools...

■ **ESFRI:**

- ELIXIR
- ESSS
- ICOS
- LIFEWATCH
- CLARIN
- BBMRI, EPOS, EISCAT-3D, ...

- Enabling X disciplinary research
- Rationalization
- However:
 - Each of the ESFRI projects have their own Distributed Computing Infrastructure
 - WLCG alone have several
- The idea of a common infrastructure for eScience seems unrealistic

- New goals ?

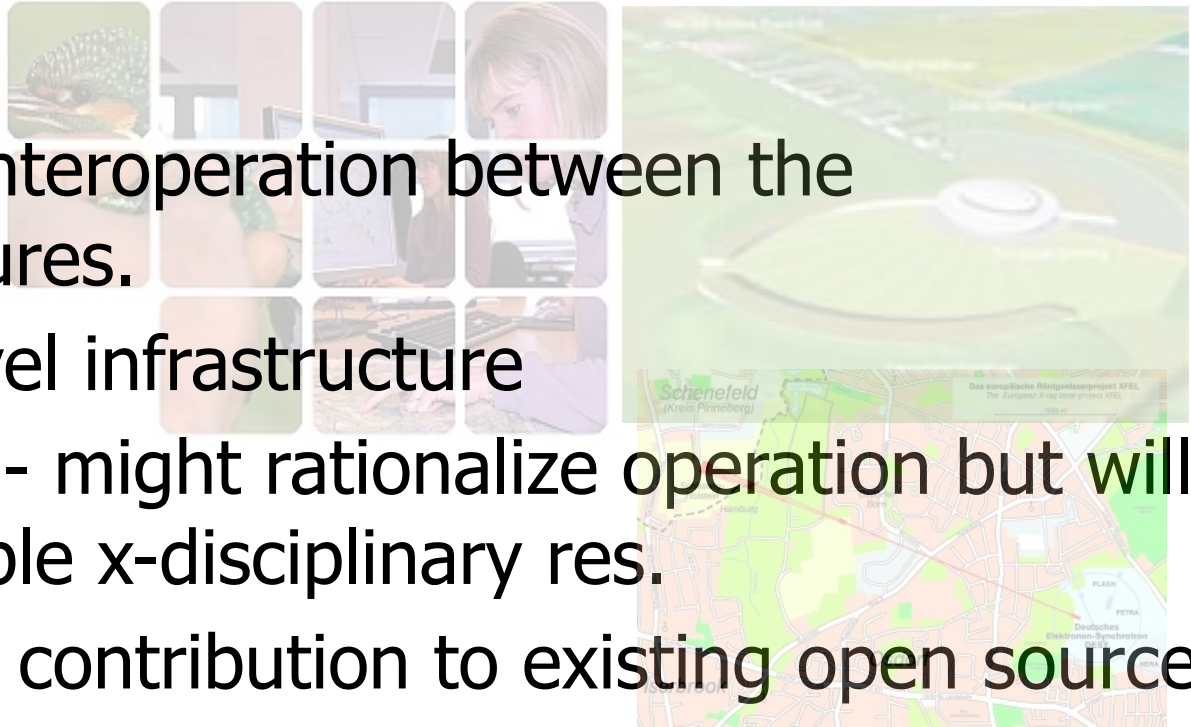

- Targeted Interoperation between the infrastructures.

- A lower level infrastructure

- Clouds? - might rationalize operation but will not enable x-disciplinary res.

- Use of and contribution to existing open source projects

- Long perspective ?

Discussion

Counting communities has started ;-)
