

The Weakest Links in the Fastest Nets... ...Need Fixing First

Erik-Jan Bos (NORDUnet / JIB Consult)

NORDUnet2011
Reykjavik, Iceland
June 7, 2011

Erik-Jan Bos

- Datacoms consultant with a few years of experience in the NREN world
- First foot on Iceland: NORDUnet2003 and GLIF in August 2003
- Thankful to Eyjafjallajökull (more later)
- The opinions and errors in this presentation are mine, and not necessarily those of one or more of the organisations mentioned on the previous page.

Introduction

- (N)RENs have come a long way, 20+ years
- Strong networks on continents
- Weak interconnection between continents
- How does this landscape look?
- And what are our challenges?

New research → New Network Requirements

- Explosion in the amount of data from experiments and simulations (Challenge #5 from Rene Buch)
- Need for near real-time processing of very large datasets
- Increase in remote collaboration:
 - Distributed sensors
 - Shared computing and storage grids
 - Virtual teams, virtual organisations
 - Accessing cloud services in a seamless way

Example of Data Intensive Science: IJkdijk, Sensors in Dikes

- First controlled dike breach in September 2008
- 30.000 sensors (microphones) needed for the Dutch dikes

Example of Data Intensive Science: e-VLBI, a radiotelescope the size of the earth

Image by Paul Boven (boven@jive.nl). Satellite image: Blue Marble Next Generation, courtesy of Nasa Visible Earth (visibleearth.nasa.gov).

Example of Data Intensive Science: Large Hadron Collider: ~20 Pbyte/year

Example of Data Intensive Work: Academy of Motion Picture

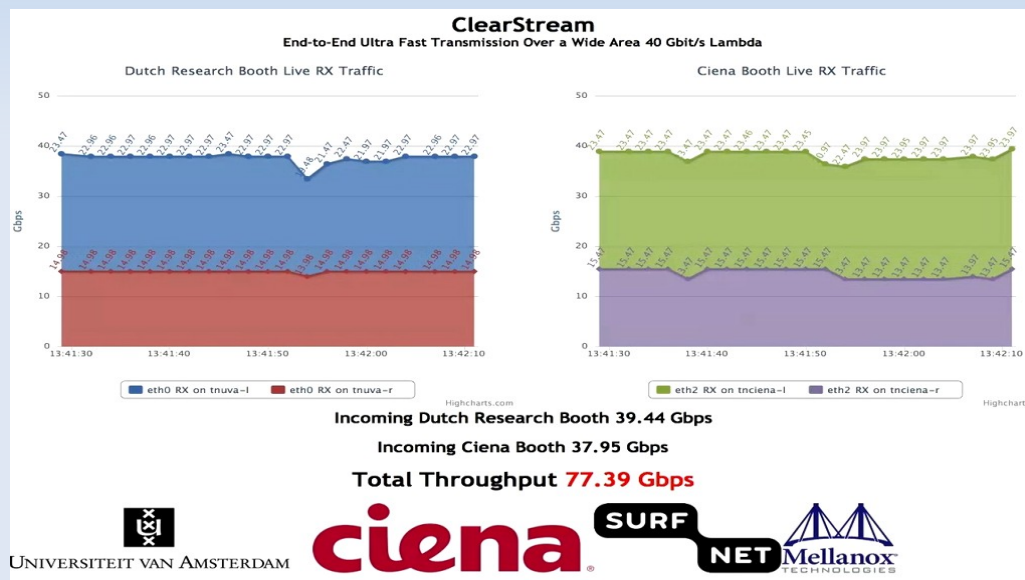

- More than 2 Pbytes for one entirely digital movie production
- Expected: 5 Pbyte/week = 250 Pbyte/year

A screenshot of the Academy of Motion Picture Arts and Sciences website. The header features the Academy logo and the text "THE ACADEMY OF MOTION PICTURE ARTS AND SCIENCES". Below the header is a navigation menu with links for "The Awards", "Meet The Academy", "Events & Exhibitions", "Science & Technology", "Education & Outreach", and "Research & Preservation". The main content area is dominated by a "SUMMER OF SILENTS" banner, which includes three historical film stills and the text "PHOTOPLAY AWARD WINNERS OF THE SILENT ERA" and "CLICK HERE FOR INFORMATION ON SERIES TICKETS". Below the banner are three sections: "Video Highlights" with a "SUMMER OF SILENTS" trailer link, "Experience The Academy" with an "OSCAR LEGACY" section for the 1929-2011 ceremony, and "What's New" with a link to "Explore The War Film Collection". The footer contains a search bar, a link to the "Academy Awards® Database", and a "Press" link.

Example of Data Intensive Experiment: ClearStream: 40G data transport over 1600+ km

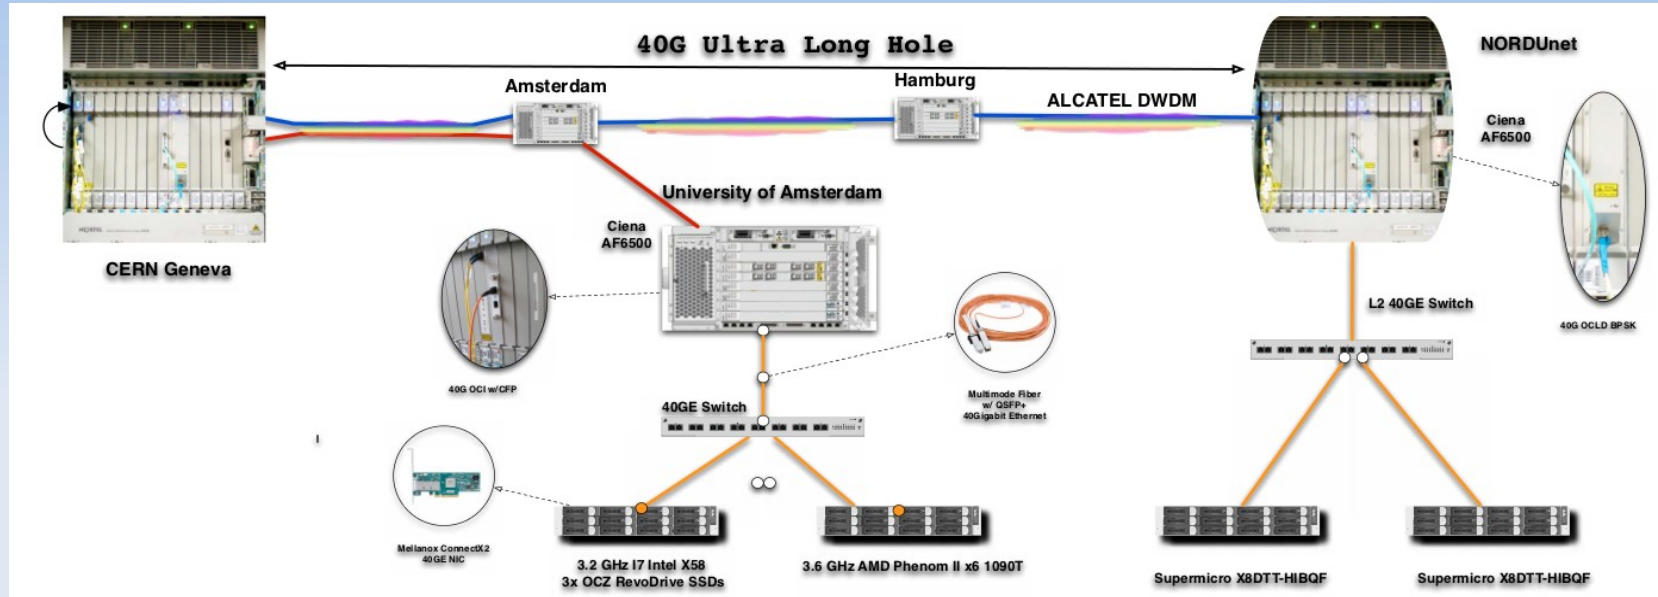

- 1600 km dark fiber, Ciena 40G optics, Mellanox PCI cards: <http://ext.delaat.net/posters/2010-11-11-ClearStream-sc.pdf>

- Thank you, Eyjafjallajökull, for locking up CdL and EJB

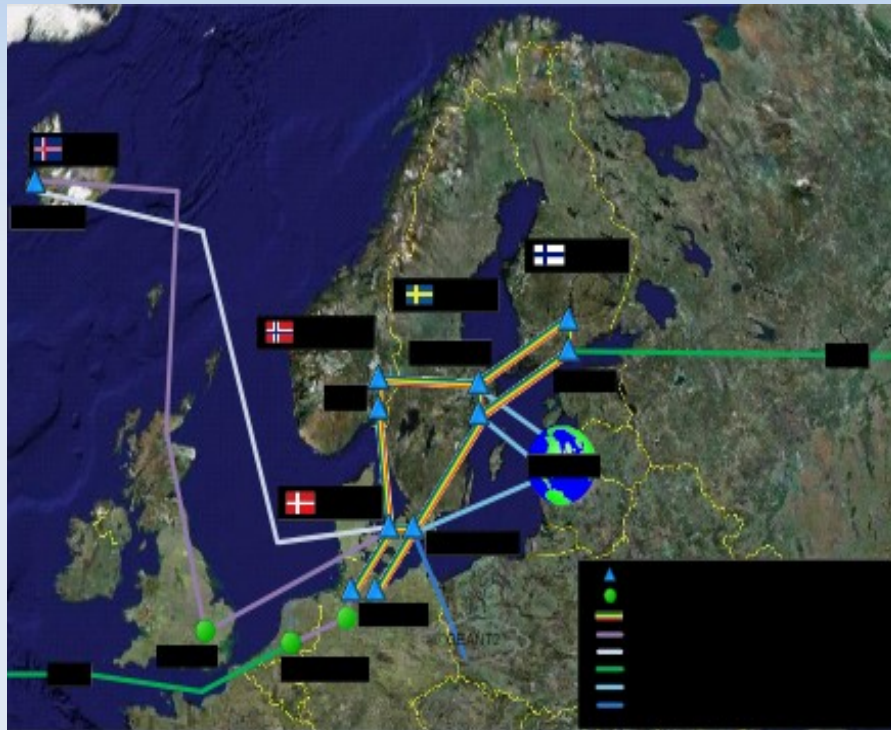

ClearStream: 10G long-haul boundary gone (@TNC2011)

- Cross-border fiber, lit with 40G SURFnet Ciena and NORDUnet Alcatel-Lucent photonics gear
- 40 Gbit/s lambda, 4400 km, partly as alien wave
- Pushing data at 25+ Gbit/s core to core
- <http://tnc11.delaat.net/>

NORDUnet: Serving the 5 Nordic countries

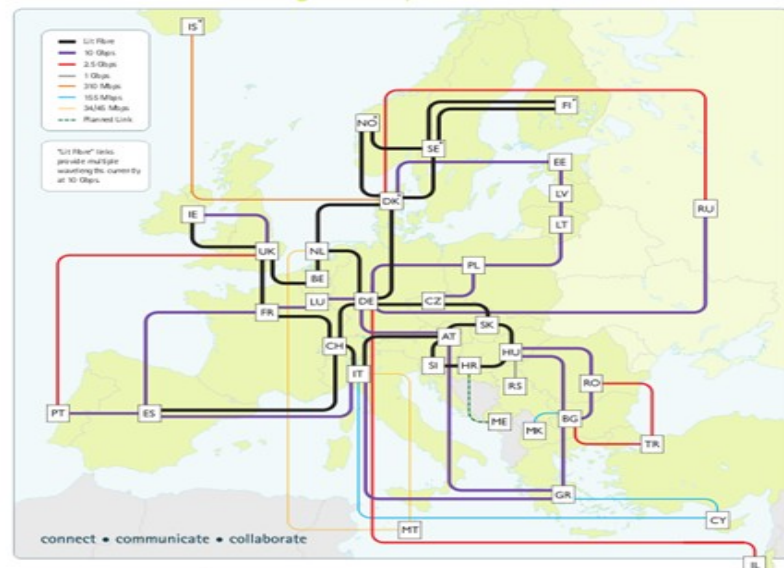

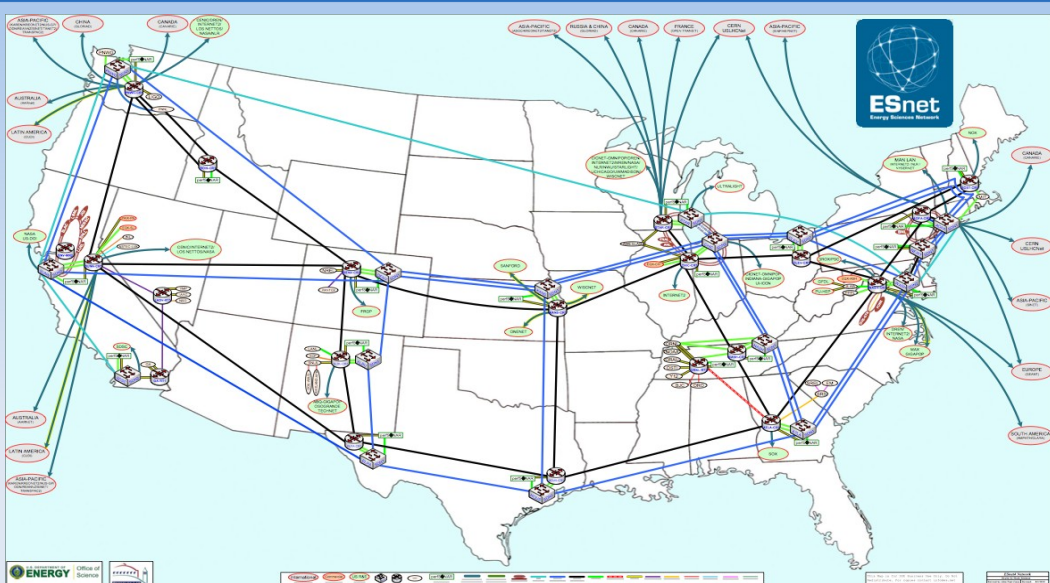

- Fully resilient photonic network
- Based on dark fiber
- Delivering IPv4, IPv6 and lightpath services
- Well connected to other regions

SURFnet: End-to-end hybrid network

- 11.000+ km managed dark fiber
- Own photonic network
- Network Services:
 - IPv4 and IPv6
 - Fixed and dynamic lightpaths
- Collapsed IP backbone with routers at only 2 location

ESnet, GÉANT, Internet2's Combined and US UCAN Planned networks

U.S. UCAN

United States Unified Community Anchor Network

Planned 100 Gigabit National Network (DRAFT)

operated by INTERNET2

INTERNET2

Internet2 Combined Infrastructure Topology

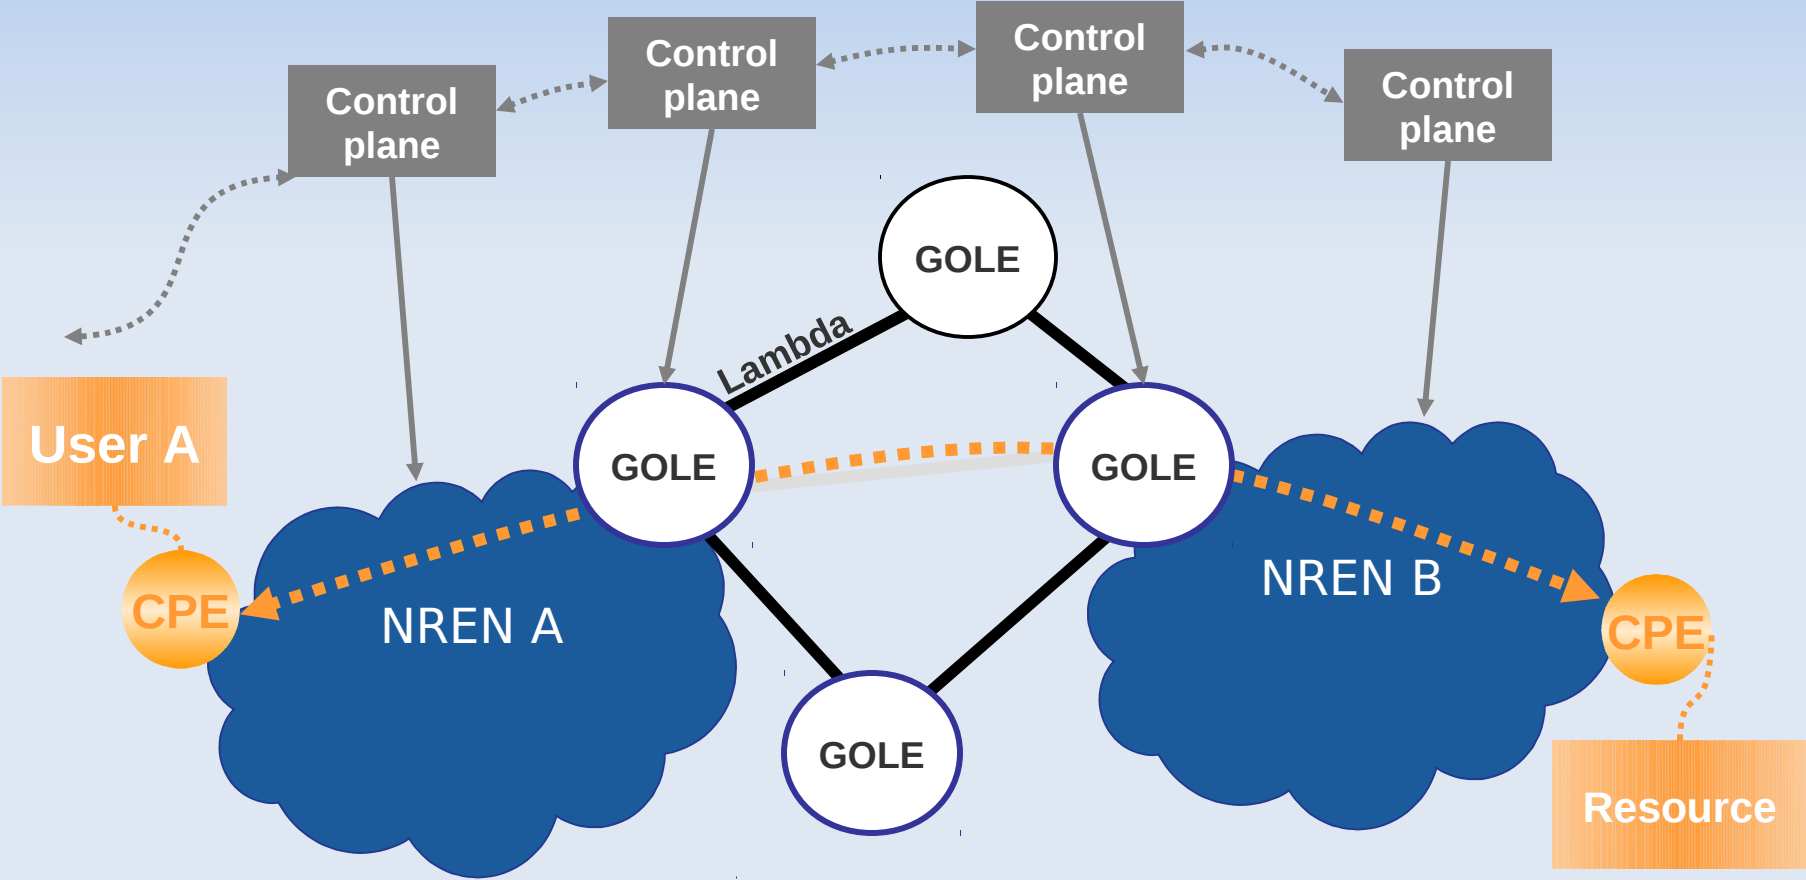

Portfolio of network infrastructure and services across the Internet2 footprint

Hybrid end-to-end network: Lightpaths

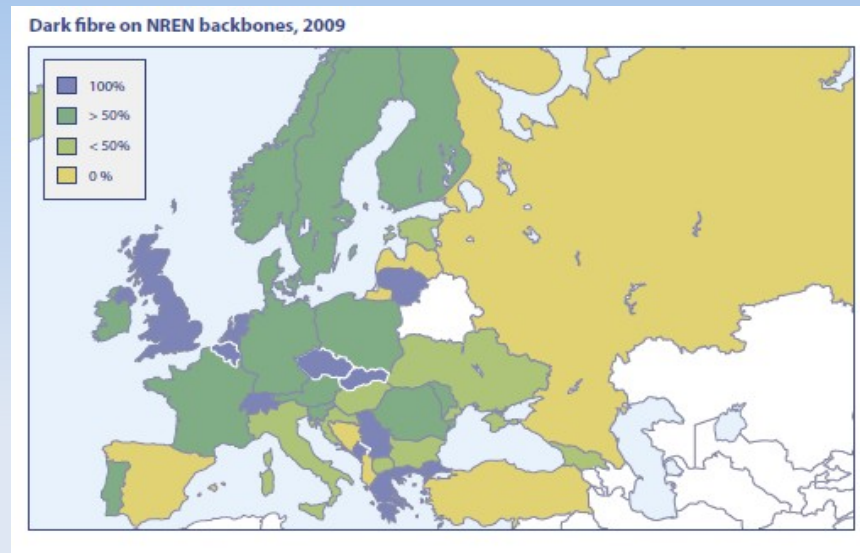

- Dark Fiber is the basis for building research infrastructures
- Lambdas form the building block for high capacity research networks
- Lightpaths are full lambdas or a dedicated part, for end-to-end, high bandwidth data transport with fixed characteristics
- Fixed lightpath: always on
- Dynamic lightpath: under control of users and their applications

Advanced approach to lambda networking

Cross Border Fiber

Strong and Weak links

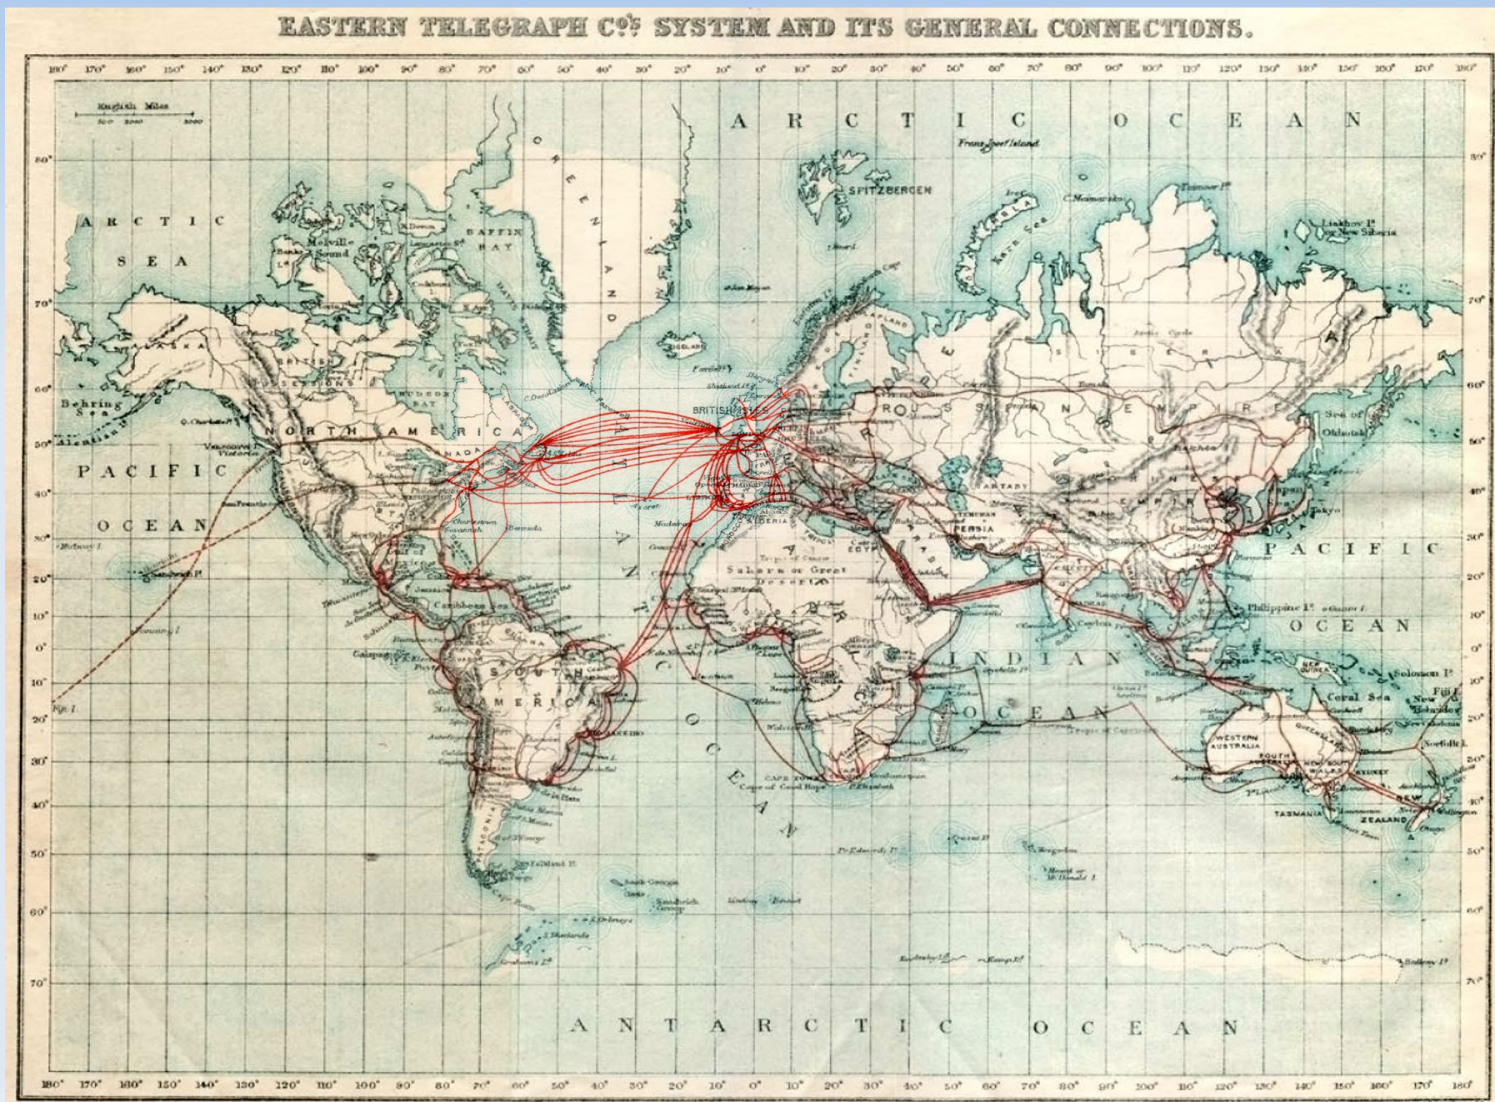

- Strong:
 - Photonics developments
 - Processing power
 - R&E Networks' infrastructures
 - Open Exchanges gaining momentum
- Weak:
 - The last mile (towards labs/showfloors)
 - Trans-Oceanic and inter-continental

EASTERN TELEGRAPH CO.'S SYSTEM AND ITS GENERAL CONNECTIONS.

Eastern Telegraph Company network in 1901

Intercontinental Cable Systems (recent)

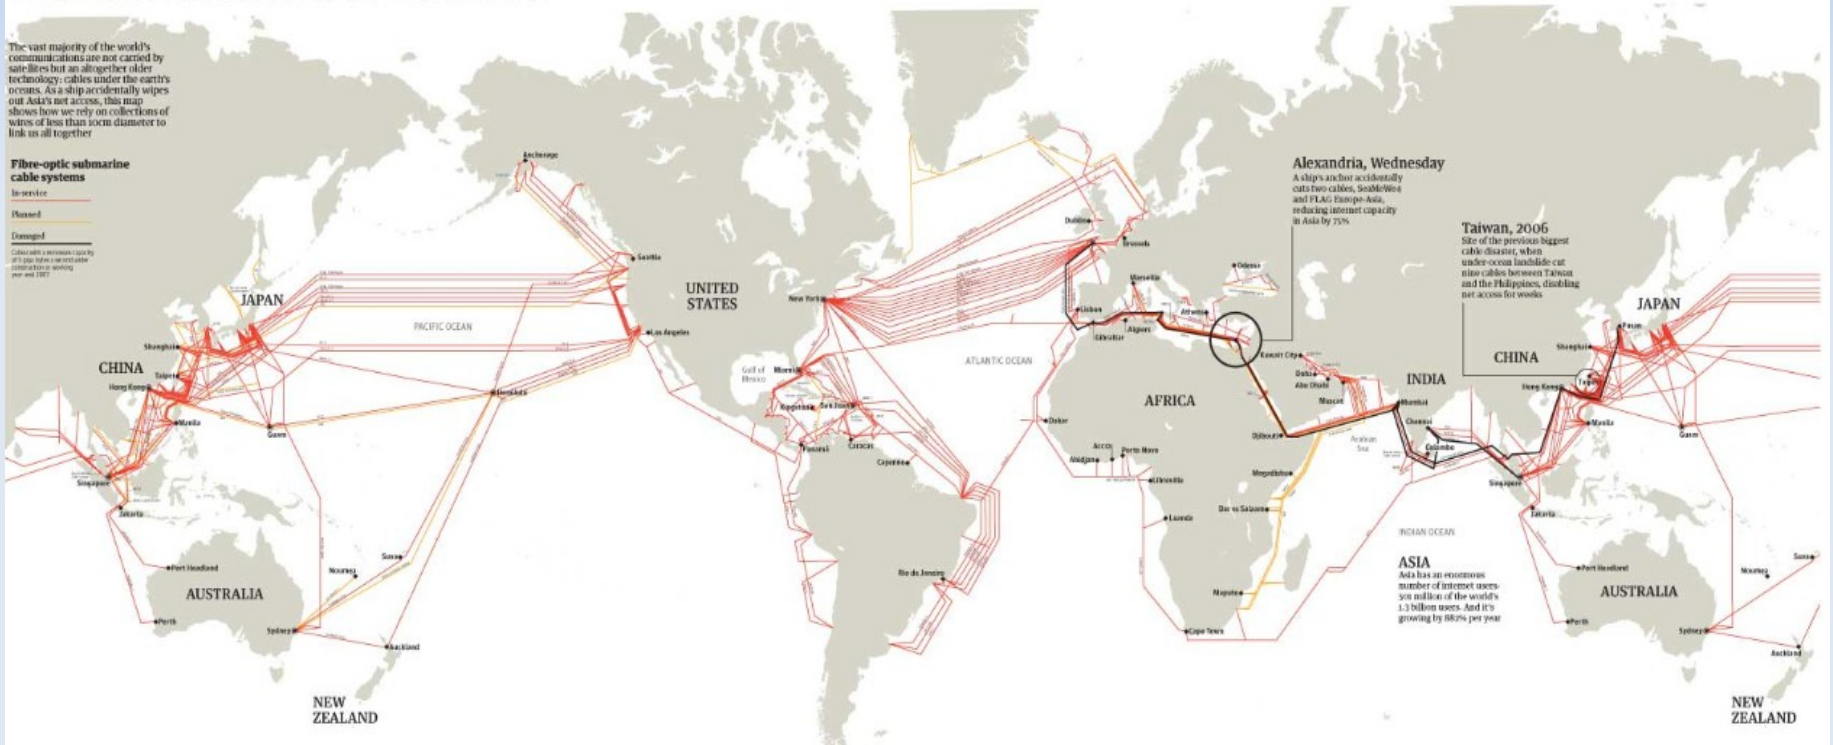

The internet's undersea world

The vast majority of the world's communications are not carried by satellites but an altogether older technology: cables under the earth's oceans. As a ship accidentally wipes out Asia's net access, this map shows how we rely on collections of wires of less than 1cm diameter to link us all together.

Fibre-optic submarine cable systems

- In-service
- Planned
- Damaged

Capacity is a measure of capacity of a cable system (number of channels or working km/sec/Hz)

GLIF (Global Lambda Integrated Facility) Map 2011

Conclusions

- The demands from research users are still (way) ahead of what the market can provide:
 - Data tsunami, Many users, Real time
- Many NRENs on continents such as Europe and North-America have fixed the bandwidth problem for their constituency
- Now we need efficient methods of handling this bandwidth:
 - Alien Light, Open Exchanges, E2E agile photonics
- The final frontier of (N)REN's network infrastructures: Intercontinental dark (dim) fiber

Thank you. Questions?
