

Home

SUNET COIP is...

- a generalized VO platform
- a tool for managing eduPersonEntitlement values
- an AA datasource for SAMLv2 federations
- compatible with Shibboleth SP-centric attribute aggregation
- compatible with the SWAMI GMAI authorization information model

About

- COIP is developed by NORDUnet under a SUNET contract.

Status

COIP is undergoing active development. The demonstration site is available and we are actively seeing SPs who are interested in test-integration. COIP is also contributing in the JRA3-T2 activity of the Geant3 project where VO-platforms are being standardized for the R&E community. One area of development is to add a subset of OpenSocial to COIP for front-channel integration with service-providers.
