Configure Shibboleth Service Provider for COIP

Configure Shibboleth Service Provider for COIP

In order to get additional attributes from COIP the Shibboleth-SP needs to be configured with an AttributeResolver of type SimpleAggregation. This is accomplished with the following configuration in shibboleth2.xml:

```
<AttributeResolver type="Chaining">
 <AttributeResolver type="Query"/
  <AttributeResolver type="SimpleAggregation" attributeId="eppn" format="urn:oid:1.3.6.1.4.1.5923.1.1.1.6:
NameID">
   <Entity>https://coip-test.sunet.se/idp/shibboleth</Entity>
 </AttributeResolver>
</AttributeResolver>
```

Restart your Shibboleth daemon.
When you now login via your application your SP will get additional entitlement attributes from COIP.
For more information, see the official documentation
