Building from Source

Requirements

- GIT
- Maven2
- Java 1.6 JDK
- A working Internet connection (to download dependencies during the build process)

The examples below assumes a linux/unix/macos environment. Windows should work also but you may have to install cygwin in order to get GIT to work.

Download the source

Download (clone) the GIT code repository.

```
# git clone git://git.nordu.net/saml-md-aggregator.git
```

Build

Build the source using maven2

```
# cd saml-md-aggregator
# mvn
```

If all goes well you should have a file `target/saml-md-aggregator-standalone.jar` which contains the standalone version. There should also be a `target/saml-md-aggregator.war` which you should be able to deploy in any servlet container.
